Seatwork 1.1 Algorithm, Flowchart, Pseudocode

1. Compute the total and average of 3 quizzes then display the total and average.

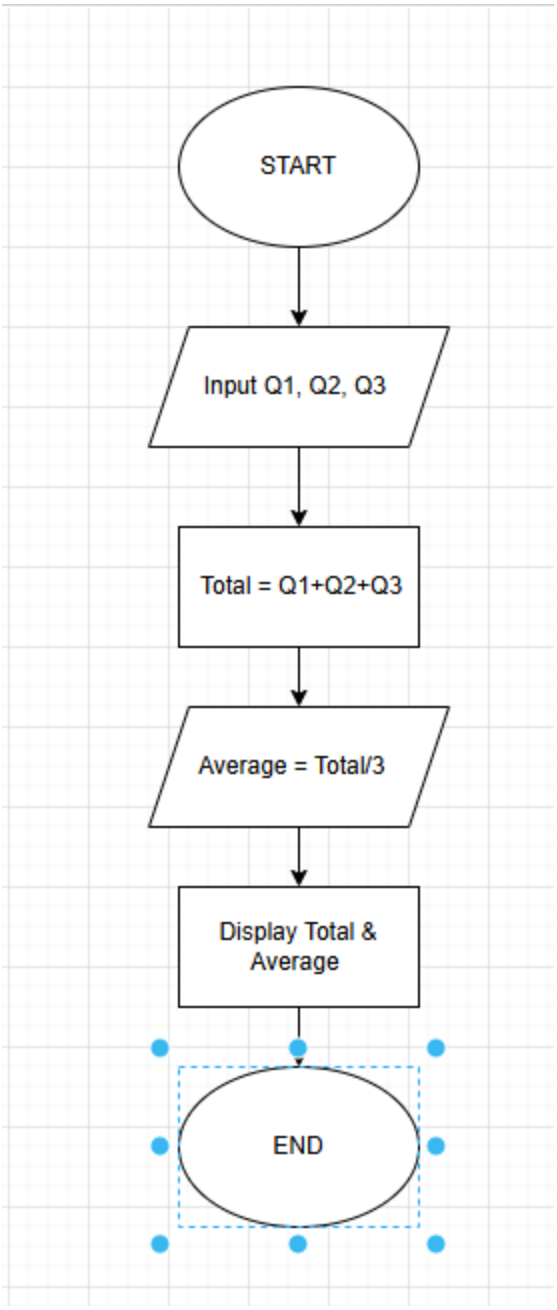

Algorithm

1. Start.
2. Input Quiz 1, Quiz 2, and Quiz 3 scores.
3. Compute the total.
4. Compute the average.
5. Display the total.
6. Display the average.
7. End.

Pseudocode

START
Input Quiz1
Input Quiz2
Input Quiz3
Total = Quiz1 + Quiz2 + Quiz3
Average = Total / 3
Display Total
Display Average
END

Flowchart

This program is made to calculate the total and average of three quiz scores. It starts by asking the user to enter the scores for each quiz. After all the scores are entered, the program adds them together to get the total score. It then divides the total by three to find the average. Finally, it displays both the total and the average, making it easy for the user to see their overall performance.

Formula Used:

- **Total = Quiz 1 + Quiz 2 + Quiz 3**
- **Average = Total ÷ 3**

This activity helped me understand how to use user input, perform basic calculations, and display the results using C++.

2. Cashiering system that computes for total price of the 3 items bought, accept payment and computes change. Display the transactions made.

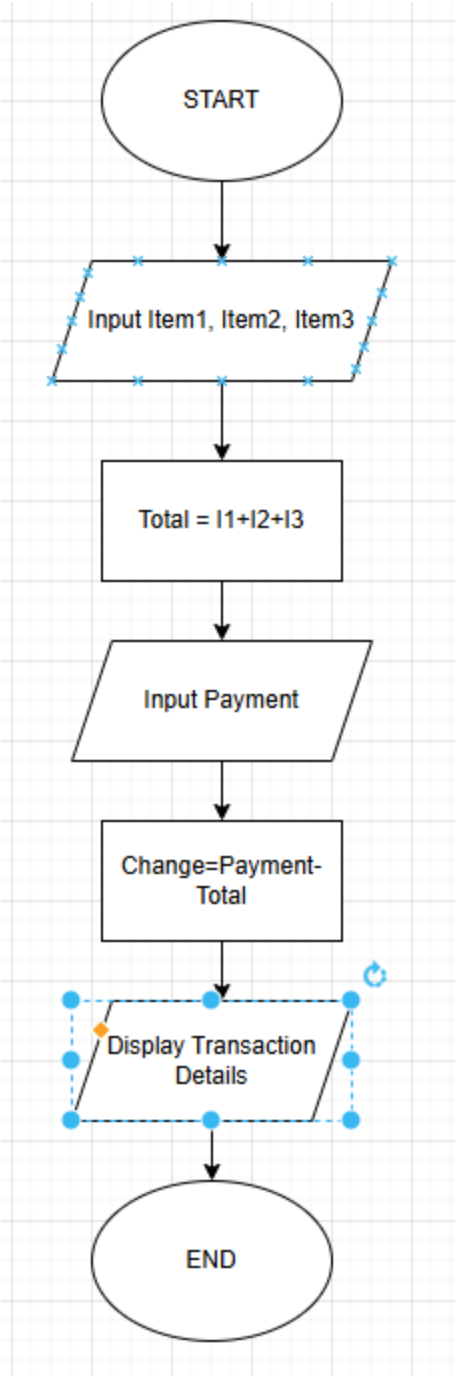

Algorithm

1. Start.
2. Input the price of Item 1, Item 2, and Item 3.
3. Compute the total price.
4. Input the customer's payment.
5. Compute the change.
6. Display the item prices, total price, payment, and change.
7. End.

Pseudocode

START
Input Item1
Input Item2
Input Item3
Total = Item1 + Item2 + Item3
Input Payment
Change = Payment - Total
Display Item1
Display Item2
Display Item3
Display Total
Display Payment
Display Change
END

Flowchart

This program simulates a simple cashiering system. It begins by asking the user to enter the prices of three items. After all the prices are entered, the program adds them to calculate the total amount. The user is then asked to enter the payment. The program subtracts the total amount from the payment to determine the correct change. Finally, it displays the item prices, the total amount, the payment received, and the change to complete the transaction.

Formula Used:

- **Total Amount = Item 1 + Item 2 + Item 3**

- **Change = Payment − Total Amount**

This activity helped me understand how simple calculations are used in real-life situations, such as processing purchases and calculating a customer's change in a cashiering system.
